EXPLANATORY STATEMENT.

The figures relating to Births and Deaths are tabulated from Returns furnished by the Local Registrars, those relating to Marriages from Returns received from the Clergy, Authorised Persons, Registrars of Marriages, &c. The live births and deaths for the English and Welsh towns in Tables III., V., VI. and VII. have been provisionally corrected by the exclusion of those not belonging to the town and as far as possible by the inclusion of those belonging to the town but occurring in other areas. These figures may not correspond exactly with the revised figures published later in the Statistical Review.

The figures relating to Notifications of Infectious Diseases are summarised from those published in the Weekly Returns, adjusted in respect of any returns or corrections received too late for insertion in that series.

Table I. shows, for England and Wales, the Marriages, Births and Deaths for the 10 years preceding, and for each quarter of those years.

Table II. shows the Annual Rates calculated on the above.

Table III. shows the Birth and Death Rates, and Analysis of Mortality during the last 5 quarters, in (a) England and Wales, (b) 117 County Boroughs and Great Towns, and (c) Smaller Towns with estimated resident populations 25,000-50,000 at census 1931.

Table IV. shows the Births and Deaths (distinguishing deaths of Infants under one year) in England and Wales by Administrative Counties with the Associated County Boroughs and Table IVa. the Marriages in England and Wales by Registration Counties in the Quarter under review.

Table V. shows, for the 117 County Boroughs and Great Towns and the Metropolitan Boroughs, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) and the corresponding annual rates.

Table VI. shows, for the 125 Smaller Towns, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) for the quarter.

Table VII. shows the Births and Deaths (distinguishing certain causes) and birth- and death-rates in London and in certain cities in the British Empire and in foreign countries, in the last available quarter.

Table VIII. is a summary of returns of Notified cases of Infectious Diseases. These figures are included in the present publication by arrangement with the Ministry of Health, in pursuance of Section 5 of the Census Act, 1920.

Table VIIIa. shows the local distribution of the cases of small-pox notified.

Note:—The returns for the quarters ending 30th June and 31st December respectively contain lists of the changes of boundaries of administrative areas during the six months ending on these dates, while summaries of certain figures for the year are published in the December and March quarter issues.

NOTES ON THE FIRST QUARTER OF 1932.

ENGLAND AND WALES.

Births.

The 152,212 live Births registered in the *First* Quarter of 1932 were 7,451 less than the number recorded in the corresponding Quarter of 1931, and corresponded to an annual rate of 15·3 per 1,000 of the estimated mid-year population for the year 1931. This rate is the lowest recorded in any first quarter since the establishment of civil registration. The illegitimate live Births totalled 6,474, or 666 less than the number shown in the Return for the First Quarter of 1931.

Of these 152,212 live Births 77,925 were males and 74,287 females, giving a proportion of 1,049 males to 1,000 females; the average proportion in the 10 preceding First Quarters was 1,046.

The 6,868 stillbirths registered were 223 less than the number recorded in the first Quarter of 1931, and corresponded to an annual rate of 0.69 per 1,000 of the population or 4.3 per cent. of the total births registered.

Deaths.

The Deaths (excluding stillbirths) registered numbered 153,426 and were 35,433 more than in the preceding Quarter, but 8,782 less than in the corresponding Quarter of 1931. They comprised 76,421 males and 77,005 females, a proportion of 992 males to 1,000 females. The death-rate was 15.4 per 1,000 of the population or 1.1 per 1,000 below that recorded during the First Quarter of last year.

The Mortality of infants under one year of age was equal to 87 per 1,000 registered live births. This rate was 5 per 1,000 below the average of the 10 preceding First Quarters.

Urban Mortality.

The highest death-rates from certain epidemic diseases in the 117 Great Towns (Table V.) during the quarter were as follows:—

From Measles 0.54 in Barking, 0.56 in Chesterfield, 0.59 in West Ham, 0.60 in Stoke-on Trent, 0.79 in Dagenham and 1.03 in Rotherham; from whooping cough 0.34 in Birmingham and Liverpool, 0.35 in Walsall, 0.39 in Grimsby and 0.40 in Dagenham; from diphtheria 0.37 in Ipswich, 0.41 in Kingston-upon-Hull, 0.74 in Dewsbury and 0.88 in Wakefield; from influenza 1.88 in Bournemouth, 1.97 in Gloucester, 2.24 in Bath, 2.54 in Oxford, 2.69 in Hove and 2.76 in Great Yarmouth.

The highest death-rates per 1,000 live Births from diarrhæa and enteritis among children under two years of age were 17·1 in Hastings, 18·5 in Sunderland, 18·8 in Nottingham, 22·7 in Coventry, 23·6 in West Bromwich and 25·4 in Wakefield.

Small-pox.

A death registered on the 1st April 1932, has been provisionally classified to small-pox and assigned to London (Deptford Met. B.) This death is consequently included in Table V. relating to the 13 weeks ended 2nd April, 1932.

A supplementary table (VIIIa.) showing the distribution of the cases of small-pox notified during the 13 weeks ended 2nd April, 1932, is given on page 17.

NATURAL INCREASE OR DECREASE.

The natural decrease of population by excess of Deaths over Births was 1,214 as against a decrease of 44,262 in the corresponding quarter of 1929, an increase of 26,578 in 1930 and a decrease of 2,545 in 1931.

NOTES ON MARRIAGES.—First Quarter, 1932.

The number of *persons* married in the *First* quarter of 1932 in England and Wales was 124,136, a decrease of 36,578 on the number in the preceding Quarter, but 30,928 more than that in the corresponding quarter of 1931. The number corresponds to an annual rate of 12.5 per 1,000 of the estimated mid-year population for the year 1931.

UNITED KINGDOM AND IRISH FREE STATE.— Third and Fourth Quarters, 1931.

In Great Britain and Ireland 204,653 births and 122,087 deaths were registered in the three months ended 30th September, 1931. The increase of population owing to the excess of births over deaths was therefore 82,566. The number of persons married was 228,854.

In the three months ended 31st December, 1931, there were 188,472 births and 146,517 deaths; the excess of births over deaths being 41,955. The number of persons married was 187,068.

For facts, in detail, concerning Scotland, Northern Ireland and the Irish Free State, reference should be made to the Returns published by their respective Registrars-General.

^{*} Furnished by the Director of the Meteorological Office.

Meteorology (cont.).

JANUARY, 1932.

The exceptional mildness of December 1931 was maintained during a large part of the month. The mild and damp southwesterly winds were interrupted temporarily by polar winds from between north and west on the 7th and 8th and eventually gave way about the 20th to lighter winds of Continental origin. The anticyclonic spell made the second half of the month comparatively dry, there being practically no rain over a large portion of England during this period. On the 26th the barometer stood at a remarkably high level, pressure exceeding 31 inches at some northern stations on that day (e.g. at Sheffield, Meltham, York and Stonyhurst). In western districts and in parts of the Midlands rainfall totals exceeded the normal but in eastern districts there was a deficiency. In northern districts there was an excess of sunshine but a deficit in southern and eastern districts.

FEBRUARY, 1932.

The month was on the whole cold, dull and dry. The outstanding feature of the weather of this month was the remarkable deficiency of rainfall in all districts, the general precipitation over England and Wales amounting to only 18 per cent. of the normal. In many places the month was the driest experienced since the great drought of February 1891, whilst locally in the north and west even the abnormal dryness of February 1891 was eclipsed, the month being the driest at Liverpool and Holyhead, for example, for more than 60 years. In the south-west of England some places experienced no These dry conditions were associated with rain during the month. the anticyclonic conditions which set in over the country towards the end of January and persistent winds between north-east and east. In the south of England the month was cold, the temperature remaining below 50°F. in parts of the south-east, including London. In the Midland Counties the average sunshine deficiency amounted to about 20 per cent. of the normal.

MARCH, 1932.

March was mostly cool and dry with considerable sunny periods in the south. Ground frost occurred on most nights, grass minima of 20°F. or below being not infrequently recorded. The drought which was such a remarkable feature of the weather of the previous month continued during the early days of March and although some rain fell mostly in the north on the 5th and 6th, it was not until the 8th that the drought was really broken in the south when 10 mm. or more rain fell in some places. Subsequently there was a renewal of dry anticyclonic conditions which continued until the 20th when a change to unsettled rainy conditions took place. During this dry period some very good sunshine records were obtained, 10 hours or more being recorded in places. At the end of the month cold northerly winds reaching gale force locally were spreading over western districts. The only considerable area with an excess of precipitation embraced the north-east of England; in most other places there was a deficiency which was greatest in the south. Over the country as a whole the general precipitation was about 12 per cent. below the March average. It is unusual for temperature in the south not to reach 60°F. during March as was the case this year when 59°F. (at Tavistock on the 16th and at Cambridge on the 19th) was the highest recorded. Low temperatures were recorded about the 12th.

(1) are as follows:—Derby C.B., 143,400; Northampton C.B., 67,740; Lincoln C.B., 65,860; Norwich C.B., 126,100; Exeter C.B., 64,780; Plymouth C.B., 193,500; Newport C.B., 86,210.

† The populations of Edinburgh Assay and Dublin are estimated to the middle of 1832; that of Belfasts is the 1892 Census figure, yearly estimates having been discontinued. Deaths in Edinburgh and Glasgow are provisionally corrected by the deduction of deaths of non-residents domiciled in Scotland and by the addition of deaths of residents reported from elsewhere in Scotland. Births are similarly corrected. Deaths in Belfast are corrected by the exclusion of deaths of persons admitted into public institutions from without the area and by the inclusion.

ABLE VI.—Population, Births and Deaths) 125 Smaller Towns (with estimated resident registered in the Quarter ended 31st

population at 1931 Census of 25,000-

March, 1932.) (50,000).

EXPLANATORY STATEMENT.

The figures relating to Births and Deaths are tabulated from Returns furnished by the Local Registrars, those relating to Marriages from Returns received from the Clergy, Authorised Persons, Registrars of Marriages, &c. The live births and deaths for the English and Welsh towns in Tables III., V., VI. and VII. have been provisionally corrected by the exclusion of those not belonging to the town and as far as possible by the inclusion of those belonging to the town but occurring in other areas. These figures may not correspond exactly with the revised figures published later in the Statistical Review.

The figures relating to Notifications of Infectious Diseases are summarised from those published in the Weekly Returns, adjusted in respect of any returns or corrections received too late for insertion in that series.

Table I. shows, for England and Wales, the Marriages, Births and Deaths for the 10 years preceding, and for each quarter of those years.

Table II. shows the Annual Rates calculated on the above.

Table III. shows the Birth and Death Rates and Analysis of Mortality during the last 5 quarters, in (a) England and Wales, (b) 118 County Boroughs and Great Towns, and (c) Smaller Towns with estimated resident populations 25,000-50,000 at census 1931.

Table IV. shows the Births and Deaths (distinguishing deaths of Infants under one year) in England and Wales by Administrative Counties with the Associated County Boroughs and Table IVa. the Marriages in England and Wales by Registration Counties in the Quarter under review.

Table V. shows, for the 118 County Boroughs and Great Towns and the Metropolitan Boroughs, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) and the corresponding annual rates.

Table VI. shows, for the 125 Smaller Towns, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) for the quarter.

Table VII. shows the Births and Deaths (distinguishing certain causes) and birth- and death-rates in London and in certain cities in the British Empire and in foreign countries, in the last available quarter.

Table VIII. is a summary of returns of Notified cases of Infectious Diseases. These figures are included in the present publication by arrangement with the Ministry of Health, in pursuance of Section 5 of the Census Act, 1920.

Table VIIIa. shows the local distribution of the cases of small-pox notified.

Note:—The returns for the quarters ending 30th June and 31st December respectively contain lists of the changes of boundaries of administrative areas during the six months ending on these dates, while summaries of certain figures for the year are published in the December and March quarter issues.

15978 A 2

NOTES ON THE SECOND QUARTER OF 1932.

ENGLAND AND WALES.

Births.

The 165,456 live Births registered in the Second Quarter of 1932 were 1,696 more than the number recorded in the corresponding Quarter of 1931, and corresponded to an annual rate of 16.6 per 1,000 of the estimated mid-year population for the year 1931. The illegitimate live Births totalled 7,197, or 247 less than the number shown in the Return for the Second Quarter of 1931.

Of these 165,456 live Births 84,776 were males and 80,680 females, giving a proportion of 1,051 males to 1,000 females; the average proportion in the 10 preceding Second Quarters was 1,041.

The 7,137 stillbirths registered were 197 more than the number recorded in the Second Quarter of 1931, and corresponded to an annual rate of 0.72 per 1,000 of the population or 4.1 per cent. of the total births registered.

Deaths.

The Deaths (excluding stillbirths) registered numbered 116,248 and were 37,178 less than in the preceding Quarter, but 1,554 more than in the corresponding Quarter of 1931. They comprised 59,806 males and 56,442 females, a proportion of 1,060 males to 1,000 females. The death-rate was 11.7 per 1,000 of the population or 0.2 per 1,000 above that recorded during the Second Quarter of last year.

The Mortality of infants under one year of age was equal to 58 per 1,000 registered live births. This rate was 7 per 1,000 below the average of the 10 preceding Second Quarters.

Urban Mortality.

The highest death-rates from certain epidemic diseases in the 118 Great Towns (Table V) during the quarter were as follows:—

From Measles 0:48 in Walthamstow, 0:64 in Derby, 0:65 in Warrington, 0:80 in Burton-upon-Trent, 0:81 in Liverpool, and 0:83 in Bootle; from whooping cough 0:26 in Edmonton, 0:27 in Finchley, 0:28 in Barnsley, 0:29 in West Hartlepool, 0:30 in Sunderland and 0:35 in Walsall; from diphtheria 0:17 in Rhondda, 0:21 in Bootle, 0:26 in Liverpool, 0:33 in Kingston-upon-Hull and 0:52 in Dewsbury; from influenza 0:31 in Ashton-under-Lyne and Southport, 0:33 in York, 0:34 in Bolton, 0:41 in Bath and 0:50 in Barnsley.

The highest death-rates per 1,000 live Births from diarrhæa and enteritis among children under two years of age were 12.8 in Willesden and Preston, 13.3 in Sunderland, 15.3 in Stoke-on-Trent 16.7 in West Hartlepool and 18.5 in West Bromwich.

Small-pox.

During the quarter small-pox was mentioned as a cause of death in two cases which have been provisionally classified to small-pox and assigned to London (Bermondsey Met. B. and Camberwell Met. B.).

A supplementary table (VIIIa.) showing the distribution of the cases of small-pox notified during the 13 weeks ended 2nd July, 1932, is given on page 17.

NATURAL INCREASE OR DECREASE.

The natural *increase* of population by excess of Births over Deaths was 49,208 as against natural increases of 50,723, 58,706 and 49,066 in the corresponding quarters of 1929, 1930 and 1931.

NOTES ON MARRIAGES.—Second Quarter, 1932.

The number of *persons* married in the *Second* quarter of 1932 in England and Wales was 137,200, an increase of 13,064 on the number in the preceding Quarter, but 32,938 less than that in the corresponding quarter of 1931. The number corresponds to an annual rate of 13.8 per 1,000 of the estimated mid-year population for the year 1931.

UNITED KINGDOM AND IRISH FREE STATE.— First Quarter, 1932.

In Great Britain and Ireland 195,321 births and 191,607 deaths were registered in the three months ended 31st March, 1932. The increase of population owing to the excess of births over deaths was therefore 3,714. The number of persons married was 149,014.

For facts, in detail, concerning Scotland, Northern Ireland and the Irish Free State, reference should be made to the Returns published by their respective Registrars-General.

^{*} Furnished by the Director of the Meteorological Office.

Meteorology (cont.).

APRIL, 1932.

The weather during April was on the whole ansettled and wet. Precipitation occurred frequently but daily amounts exceeding an inch were rare. In almost all districts there was a pronounced excess of precipitation, monthly totals exceeding twice the normal locally in England and over a large area in Wales. Amidst this general large excess the deficiency recorded in parts of Durham and York (N. Riding) was in sharp contrast. Snow, sleet and hail with local thunder occurred during the first fortnight and between the 20th and 26th, most frequently in northern districts. Apart from a relatively mild spell during the last three days, the days were cool although minimum temperatures at night frequently exceeded the normal. The cool character of the month was reflected in the mean temperatures, which were generally from 1° - 3°F. below the normal. In many places the month was the coldest April since 1922. In several places maximum temperatures of 60°F, and over were recorded on one or more of the last three days. A marked deficiency of sunshine was recorded in all districts.

MAY, 1932.

The most remarkable features of the weather of May were pronounced excess of rainfall and the destructive floods in the Midlands and Yorkshire. Few places had less than 20 days with measurable precipitation and over the country generally the month ranks as the wettest May for the past 160 years. The areas most severely affected by the severe and widespread flooding round about the 22nd were in the Don Valley at Bentley, the districts in and around Burton, Derby and Nottingham and in Warwickshire and Worcestershire. Apart from brief warm spells about the 20th and towards the end of the month the days were mostly cool, markedly so from about the 4th-9th. The nights however, were often mild so that mean temperatures were not very much below normal. Sunshine aggregates were well below the normal, the deficiency being greatest in the Midlands where several places had less than half their normal May sunshine. In some districts the month was the dullest May on record, e.g. at Kew Observatory where records extend back to 1880.

JUNE, 1932.

In sharp contrast to the excessive wetness of May, the outstanding feature of the weather of June was its pronounced dryness, the general precipitation over the country as a whole only slightly exceeding half the normal. Apart from heavy falls in the South on the 3rd and 4th and local thundery rain or showers on the 10th and 11th, the dry weather prevailed generally up to the 25th in the North and to the 27th in the South. Heavy falls occurred in many parts of the country during the night of the 30th June and July 1st and accounted in many places for the greater part of the month's At Cheltenham there was an absolute drought of 29 days (May 30th—June 27th) and one of 28 days at Harrogate (May 30th— June 26th) and Halstead (June 2n 1-29th). Severe thunderstorms accompanied by heavy rain occurred at North Cornwall on the 3rd. The warmest days occurred about the 16th and 27th, the temperature rising above 80°F. on the latter day in several places. There were two short spells of a cold northerly type of weather about the 5th and 19th, maximum temperatures failing to reach 60° even in some southern places on the 4th, 5th and 6th and on the 19th and 20th. As a result of these fluctuations monthly mean temperatures were slightly above the normal in the west and somewhat below the normal elsewhere. In western districts there was a considerable excess of sunshine but in Eastern England aggregates were deficient. In coastal districts in Devon and Cornwall the mean daily duration of bright sunshine exceeded 9 hours, amounting to as much as 10·3 hours at Newquay.

Library.

EXPLANATORY STATEMENT.

The figures relating to Births and Deaths are tabulated from Returns furnished by the Local Registrars, those relating to Marriages from Returns received from the Clergy, Authorised Persons, Registrars of Marriages, &c. The live births and deaths for the English and Welsh towns in Tables III., V., VI. and VII. have been provisionally corrected by the exclusion of those not belonging to the town and as far as possible by the inclusion of those belonging to the town but occurring in other areas. These figures may not correspond exactly with the revised figures published later in the Statistical Review.

The figures relating to Notifications of Infectious Diseases are summarised from those published in the Weekly Returns, adjusted in respect of any returns or corrections received too late for insertion in that series.

Table I. shows, for England and Wales, the Marriages, Births and Deaths for the 10 years preceding, and for each quarter of those years.

Table II. shows the Annual Rates calculated on the above.

Table III. shows the Birth and Death Rates, and Analysis of Mortality during the last 5 quarters, in (a) England and Wales, (b) 118 County Boroughs and Great Towns, and (c) Smaller Towns with estimated resident populations 25,000-50,000 at census 1931.

Table IV. shows the Births and Deaths (distinguishing deaths of Infants under one year) in England and Wales by Administrative Counties with the Associated County Boroughs and Table IVa. the Marriages in England and Wales by Registration Counties in the Quarter under review.

Table V. shows, for the 118 County Boroughs and Great Towns and the Metropolitan Boroughs, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) and the corresponding annual rates.

Table VI. shows, for the 126 Smaller Towns, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) for the quarter.

Table VII. shows the Births and Deaths (distinguishing certain causes) and birth- and death-rates in London and in certain cities in the British Empire and in foreign countries, in the last available quarter.

Table VIII. is a summary of returns of Notified cases of Infectious Diseases. These figures are included in the present publication by arrangement with the Ministry of Health, in pursuance of Section 5 of the Census Act, 1920.

Table VIIIa. shows the local distribution of the cases of small-pox notified.

Note:—The returns for the quarters ending 30th June and 31st December respectively contain lists of the changes of boundaries of administrative areas during the six months ending on these dates, while summaries of certain figures for the year are published in the December and March quarter issues.

NOTES ON THE THIRD QUARTER OF 1932.

ENGLAND AND WALES.

Births.

The 156,302 live Births registered in the *Third* Quarter of 1932 were 4,831 less than the number recorded in the corresponding Quarter of 1931, and corresponded to an annual rate of 15.5 per 1,000 of the estimated mid-year population for the year 1931. The illegitimate live Births totalled 6,775, or 69 less than the number shown in the Return for the Third Quarter of 1931.

Of these 156,302 live Births 79,934 were males and 76,368 females, giving a proportion of 1,047 males to 1,000 females; the average proportion in the 10 preceding Third Quarters was 1,047.

The 6,283 stillbirths registered were 285 less than the number recorded in the Third Quarter of 1931, and corresponded to an annual rate of 0.62 per 1,000 of the population or 3.9 per cent. of the total births registered.

Deaths.

The Deaths (excluding stillbirths) registered numbered 97,951 and were 18,297 less than in the preceding Quarter, but 1,216 more than in the corresponding Quarter of 1931. They comprised 50,352 males and 47,599 females, a proportion of 1,058 males to 1,000 females. The death-rate was 9.7 per 1,000 of the population or 0.1 per 1,000 above that recorded during the Third Quarter of last year.

The Mortality of infants under one year of age was equal to 49 per 1,000 registered live births. This rate was 4 per 1,000 below the average of the 10 preceding Third Quarters.

Urban Mortality.

'The highest death-rates from certain epidemic diseases in the 118 Great Towns (Table V) during the quarter were as follows:—

From Measles 0·15 in Warrington, 0·17 in Coventry, 0·23 in Ashton-under-Lyne, 0·24 in Liverpool, 0·45 in Gateshead and 0·47 in Wigan; from whooping cough 0·17 in Kingston-upon-Hull, 0·18 in Stockton-on-Tees and West Hartlepool, 0·24 in Lincoln, 0·26 in Middlesbrough and 0·29 in York; from diphtheria 0·26 in Edmonton, 0·27 in Wakefield, 0·28 in Acton, 0·29 in Dewsbury and Kingston-upon-Hull and 0·33 in York; from influenza 0·10 in Gateshead and Stockport, 0·11 in South Shields, 0·14 in Rhondda and 0·15 in Warrington.

The highest death-rates per 1,000 live Births from diarrhæa and enteritis among children under two years of age were 19.0 in Birkenhead and St. Helens, 19.6 in West Ham, 20.1 in Liverpool, 25.3 in Mitcham and 26.3 in West Bromwich.

Small-pox.

There were no deaths from small-pox registered during the quarter.

A supplementary table (VIIIa.) showing the distribution of the cases of small-pox notified during the 13 weeks ended 1st October, 1932, is given on page 17.

NATURAL INCREASE OR DECREASE.

The natural *increase* of population by excess of Births over Deaths was 58,351 as against natural increases of 67,028, 69,207 and 64,398 in the corresponding quarters of 1929, 1930 and 1931.

NOTES ON MARRIAGES.—Third Quarter, 1932.

The number of *persons* married in the *Third* quarter of 1932 in England and Wales was 189,324, an increase of 52,124 on the number in the preceding Quarter, but 9,506 less than that in the corresponding quarter of 1931. The number corresponds to an annual rate of 18.8 per 1,000 of the estimated mid-year population for the year 1931.

UNITED KINGDOM AND IRISH FREE STATE.— Second Quarter, 1932.

In Great Britain and Ireland 211,050 births and 148,529 deaths were registered in the three months ended 30th June, 1932. The increase of population owing to the excess of births over deaths was therefore 62,521. The number of persons married was 162,384.

For facts, in detail, concerning Scotland, Northern Ireland and the Irish Free State, reference should be made to the Returns published by their respective Registrars-General.

^{*} Furnished by the Director of the Meteorological Office.

Meteorology (cont.).

JULY, 1932.

The cloudy and unsettled weather of this month was in strong contrast with that of June. Up to the 8th, unsettled conditions prevailed with winds mainly from between south and west. Rain fell at times but in the south-east measurements were generally small and many sunny days were enjoyed along the south coast of England. The most settled weather occurred between the 8th and the 10th. The situation changed rapidly about the 11th and subsequently mainly cool, unsettled conditions prevailed, with widespread thunderstorms at times, until the 29th. Temperature for the month was on the average slightly above the normal, the highest readings occurring almost without exception between the 9th and the 12th, as a rule on the 10th. Over most of the inland and eastern districts of England, maxima. of 80°F. and over were recorded, the highest being 86°F. at Pontefract (Yorks.) and Attenborough (Notts.) on the 10th and at London on the 10th and 11th. Although rainfall was in all districts above the normal, it was very variable owing to the exceptionally heavy falls which occurred during the numerous thunderstorms. At Cranwell, 131 mm. fell on the 11th and 61 mm. on the 13th; at Stalybridge (near Manchester) 102 mm. fell on the 11th. Heavy and prolonged rain fell in the south around the 24th and 25th. A pronounced deficiency of sunshine was general. At Liverpool the total, 130 hours, is only 4 hours more than the lowest since 1908.

AUGUST, 1932.

The most remarkable features of the weather of August were excessive heat, particularly in southern, eastern and midland districts and severe local thunderstorms. Two very warm spells occurred around the 11th and 19th. In many places temperature exceeded 90°F. on the 19th and at the following stations record values were obtained :- Camden Square (London) 97°F., Halstead 97°F., Norwich 96°F. and Oxford 95°F. Temperature fell very rapidly in the Midlands on the 20th, the maximum at Birmingham being 66°F. as compared with 91°F, on the 19th. On the whole the month was very dry, the general precipitation being only 56 per cent. of the normal. Owing to severe local thunderstorms, however, rainfall was a very variable factor and at some isolated places there was a large excess. Thunderstorms were most widespread on the 12th, 20th and 21st, but some severe storms occurred outside these periods. Heavy falls in 24 hours include 71 mm. at Mursley on the 21st and 65 mm. at Wellington College, Berks, on the 20th. At Rickmansworth, 56.9 mm. of rain or hail fell in 45 mins. in the early morning of the 12th. The torrential nature of the rain caused serious local flooding. Sunshine was above the normal in south-east England and nearly normal in eastern England; elsewhere there was a deficiency.

SEPTEMBER, 1932.

The weather of September was for the most part unsettled and wet. With winds mainly from between south and west the first part of the month was mild and unsettled with occasional heavy rain locally. From the 14th to 17th settled warm weather prevailed and temperature rose to 75°F. or above in many places. Some

notable maxima were 81°F. at Birmingham (Sparkhill) and 80°F. at Attenborough and Worksop on the 15th, and 80°F at Tunbridge Wells on the 16th. With the onset of northerly winds on the 18th the situation changed and conditions remained rather cold and unsettled until the 28th. The mean monthly temperature thus showed little variation from the normal. The general precipitation for the month exceeded the normal for all districts except Eastern England and falls exceeded twice the normal in parts of Devonshire, Somerset, Northumberland and Lancashire. Heavy falls in 24 hours included 71 mm. at Tynywaun and Stonyhurst on the 2nd and 70 mm, at Borrowdale on the 1st. The fall at Stonyhurst was the largest daily rainfall there in September for the last 84 years. Sunshine was deficient in all districts except north-east England and the deficiency was very pronounced in southern and eastern England. At Eastbourne the total of 113 hours was the lowest recorded there in September between 1887 and 1932, while at Gorleston 109 hours was the lowest September figure since records began there in 1908.

† The populations of Edinburgh, Glasgow and Dublin are estimated to the middle of 1932; that of Belfast is the 1926 Census figure, yearly estimates having been discontinued. Deaths in Scoliaburgh and Glasgow are provisionally corrected by the deduction of deaths of non-residents domicided in Scotiaburd and by the addition of deaths of residents reported from elsewhere in Scotian. Births are similarly corrected. Deaths in Belfast are corrected by the exclusion of deaths of persons admitted into public institutions from without the area, and by the inclusion of certain institutional deaths occurring elsewhere. Births in Dublin are partially corrected by the exclusion of those belonging to outside localities which occurred in Dublin institutions and deaths are fully corrected by the exclusion of non-residents and the inclusion of Dublin residents registered in other parts of the country. The figures for Dublin, Edinburgh and Glasgow relate to the estends of the country.

EXPLANATORY STATEMENT.

The figures relating to Births and Deaths are tabulated from Returns furnished by the Local Registrars, those relating to Marriages from Returns received from the Clergy, Authorised Persons, Registrars of Marriages, &c. The live births and deaths for the English and Welsh towns in Tables III., V., VI. and VII. have been provisionally corrected by the exclusion of those not belonging to the town and as far as possible by the inclusion of those belonging to the town but occurring in other areas. These figures may not correspond exactly with the revised figures published later in the Statistical Review.

The figures relating to Notifications of Infectious Diseases are summarised from those published in the Weekly Returns, adjusted in respect of any returns or corrections received too late for insertion in that series.

Table I. shows, for England and Wales, the Marriages, Births and Deaths for the 10 years preceding, and for each quarter of those years.

Table II. shows the Annual Rates calculated on the above.

Table III. shows the Birth and Death Rates and Analysis of Mortality during the last 5 quarters, in (a) England and Wales, (b) 118 County Boroughs and Great Towns, and (c) Smaller Towns with estimated resident populations 25,000-50,000 at census 1931.

Table IV. shows the Births and Deaths (distinguishing deaths of Infants under one year) in England and Wales by Administrative Counties with the Associated County Boroughs and Table IVa. the Marriages in England and Wales by Registration Counties in the Quarter under review.

Table V. shows, for the 118 County Boroughs and Great Towns and the Metropolitan Boroughs, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) and the corresponding annual rates.

Table VI. shows, for the 126 Smaller Towns, the Births and Deaths (distinguishing certain causes and deaths of Infants under one year) for the quarter.

Table VII. shows the Births and Deaths (distinguishing certain causes) and Birth and Death rates in London and in certain cities in the British Empire and in foreign countries, in the last available quarter.

Table VIII. is a summary of returns of Notified cases of Infectious Diseases. These figures are included in the present publication by arrangement with the Ministry of Health, in pursuance of Section 5 of the Census Act, 1920.

Table VIIIa. shows the local distribution of the cases of small-pox notified.

Note:—The returns for the quarters ending 30th June and 31st December respectively contain lists of the changes of boundaries of administrative areas during the six months ending on these dates, while summaries of certain figures for the year are published in the December and March quarter issues.

NOTES ON THE FOURTH QUARTER OF 1932.

ENGLAND AND WALES.

Births.

The 140,350 live Births registered in the Fourth Quarter of 1932 were 7,175 less than the number recorded in the corresponding Quarter of 1931, and corresponded to an annual rate of 13.9 per 1,000 of the estimated mid-year population for the year 1932. The illegitimate live Births totalled 5,945, or 119 less than the number shown in the Return for the Fourth Quarter of 1931.

Of these 140,350 live Births 71,960 were males and 68,390 females, giving a proportion of 1,052 males to 1,000 females; the average proportion in the 10 preceding Fourth Quarters was 1,045.

The 6,149 stillbirths registered were 185 less than the number recorded in the Fourth Quarter of 1931, and corresponded to an annual rate of 0.61 per 1,000 of the population or 4.2 per cent. of the total births registered.

Deaths.

The Deaths (excluding stillbirths) registered numbered 116,458 and were 18,507 more than in the preceding Quarter, but 1,535 less than in the corresponding Quarter of 1931. They comprised 59,231 males and 57,227 females, a proportion of 1,035 males to 1,000 females. The death-rate was 11.5 per 1,000 of the population or 0.2 per 1,000 below that recorded during the Fourth Quarter of 1931.

The Mortality of infants under one year of age was equal to 64 per 1,000 registered live births. This rate was 8 per 1,000 below the average of the 10 preceding Fourth Quarters.

Urban Mortality.

The highest death-rates from certain epidemic diseases in the 118 Great Towns (Table V) during the quarter were as follows:—

From measles 0·16 in Cardiff, 0·19 in Gateshead, 0·21 in Wolverhampton, 0·22 in Leicester, 0·39 in Chester and 0·61 in Wigan; from whooping cough 0.14 in Stretford and York, 0·21 in Bootle, 0·25 in South Shields and 0·35 in Middlesbrough; from diphtheria 0·32 in Swindon, 0·37 in Wallasey, 0·59 in Kingston-upon-Hull and Dewsbury, 0·61 in Wakefield, and 0·80 in Acton; from influenza 0·54 in Worcester, 0·55 in Newcastle-upon-Tyne, 0·61 in Birmingham, 0·63 in South Shields and 0·79 in Sunderland.

The highest death-rates per 1,000 live Births from diarrhæa and enteritis among children under two years of age were 19.6 in Kingston-upon-Hull, 19.7 in Stoke-on-Trent, 20.8 in Stockton-on-Tees, 21.7 in Newcastle-under-Lyme, 34.0 in Salford and 48.6 in West Bromwich.

SUMMARY 1932.

A summary relating to the year 1932 giving some of the Annual Tables hitherto published in the Quarterly Return for the December Quarter will be found on pages 21-26 of this publication, the tables being numbered X-XII. The remainder of the Annual Tables will be published in the next March Quarterly Return.

ENGLAND AND WALES.

According to the quarterly returns furnished by local registrars, 614,320 live births and 484,083 deaths (excluding stillbirths) were registered in England and Wales in the year 1932. The natural increase of population, by excess of births over deaths, was, therefore 130,237, the average annual increase in the preceding five years having been 162,891. The number of persons married during the year was 612,264.

Provisional rates for England and Wales in 1932 per 1,000 of the estimated population at the middle of the year, were as follows:—

Marriage rate	***		15.2
Live Birth-rate			15.3
Death-rate	• • •		12.0

The number of stillbirths per 1,000 total births (including stillbirths) was 43 and infant mortality was 65 per 1,000 live-births. The birth-rate was the lowest recorded for the fourth year in succession, being 1.0 below that for 1929 and 1930 and 0.5 below that for 1931; the death-rate was 0.3 below that for 1931 and the infant mortality rate was 1 per 1,000 below that for 1931, but 5 per 1,000 above that for 1930 which was the lowest recorded.

The marriage-rate of 15.2 is 0.4 below that for last year and 0.6 below 1929 and 1930.

Small-pox.

There were no deaths from small-pox registered during the quarter.

A supplementary table (VIIIa.) showing the distribution of the cases of small-pox notified during the 13 weeks ended 31st December, 1932, is given on page 17.

NATURAL INCREASE OR DECREASE.

The natural *increase* of population by excess of Births over Deaths was 23,892 as against natural increases of 37,692, 38,893 and 29,532 in the corresponding quarters of 1929, 1930 and 1931.

NOTES ON MARRIAGES.-Fourth Quarter, 1932.

The number of persons married in the Fourth Quarter of 1932 in England and Wales was 161,604, a decrease of 27,720 on the number in the preceding Quarter, but 648 more than that in the corresponding quarter of 1931. The number corresponds to an annual rate of 15.9 per 1,000 of the estimated mid-year population for the year 1932.

UNITED KINGDOM AND IRISH FREE STATE.— Third Quarter, 1932.

In Great Britain and Ireland 199,568 births and 123,742 deaths were registered in the three months ended 30th September, 1932. The increase of population owing to the excess of births over deaths was therefore 75,826. The number of persons married was 219,194.

For facts, in detail, concerning Scotland, Northern Ireland and the Irish Free State, reference should be made to the Returns published by their respective Registrars-General.

^{*} Furnished by the Director of the Meteorological Office.

Meteorology (cont.).

OCTOBER, 1932.

Very unsettled conditions prevailed throughout the month of October, the most noteworthy feature being the frequent and excessive rains. Winds from between north and west were unusually prevalent while strong winds and local gales were frequent from the 14th onwards. Mean temperature was everywhere a little below the normal but there were mild days when temperature reached or exceeded 60°F. locally, notably on the 1st, 7th and at times between the 16th and 23rd. The coldest spells occurred around the 4th and from the 26th to the end of the month. The lowest minimum, 25°F., was recorded at Bromyard, Appleby and Leyland on the 29th. The general precipitation over England and Wales as a whole was rather more than one and one-half times the normal and locally in Lancashire, Devonshire and the south-eastern counties rainfall aggregates slightly exceeded twice the normal. Rainfall was not only excessive but frequent, in all districts the number of rain days being appreciably in excess of the average. At Greenwich Observatory, London, it was the wettest October since 1882, at Newquay, Cornwall, in 40 years and at Southend during a period of observations covering 52 years. Among the heaviest falls in 24 hours were 81 mm. at Snowdon (Carnarvon) and 78 mm. at Trecastle (Brecon) on the 21st and 70 mm. at Princetown (Devon)

Sunshine did not differ greatly from the normal except in northeast and east England, where there was a decided deficiency. At Gorleston the total, 71 hours, was the lowest since records began in 1908. Locally in the Midland Counties and south-west England the

month was rather sunny.

NOVEMBER, 1932.

The weather of November was distinguished by a marked deficiency of sunshine. At Kew Observatory the total 26 hours has only once before (in 1888) been so small in November since records began in 1880. At Liverpool 35 hours is the lowest November total since records were started in 1908 and it was the dullest November in 31 years, observations at Totland Bay. The month was also dry, the general precipitation being only 69 per cent. of the normal. In some parts it was conspicuously dry, less than 40 per cent. of the normal being recorded in Kent and locally in Northumberland. Mean temperature for the month was a little above the normal. The opening days were rather unsettled and mild, temperature rising to 60°F, or slightly above in many places. On the 2nd maxima of 64°F, and 63°F, were recorded at Rhyl and Sealand respectively. From the 5th to the 18th an anticyclonic distribution of pressure was maintained with rather cold, easterly winds and, after the 7th, mainly gloomy weather. At Kew Observatory during the whole of the period, the 8th-20th inclusive, the total yield of sunshine was less than 1 hour. Subsequently very unsettled conditions prevailed with strong winds or gales from between south-west and north-west, occasional rain and some bright periods. A gust of 73 m.p.h. was recorded at Liverpool (Bidston) on the 27th and one of 71 m.p.h. at Pendennis Castle (Falmouth) on the 30th. A second mild spell occurred around the 25th and 26th and records of bright sunshine were good on the whole on the 21st and 28th.

DECEMBER, 1932.

The weather of December was mild, notably dry (except in Cumberland) and mainly sunny. In parts of east and south-east England less than 20 per cent. of the normal rainfall was recorded. At Eastbourne the month was the driest December on record during the period 1888 to 1932 and at Copdock, Suffolk, the total, 10 mm., was the lowest for December during 32 years' observations. In strong contrast to this marked deficiency was the excess recorded in the Lake District, where the prolonged and heavy rainfall from the 15th to the 18th caused serious flooding. At Borrowdale 286 mm. fell in these four days and at Watendlath 258 mm.

Mean temperature for the month was everywhere above the normal, the excess ranging from 3.4°F. in England N.E. to 1.6°F. in England S.W. and S. Wales. A spell of cold easterly winds prevailed from the 6th to 11th or 12th but subsequently the weather was generally extremely mild, notably from the 16th-22nd. Temperature rose to 60°F. at Llandudno on the 16th and 17th and at Bromley (Kent) on the 22nd. The nights were also very mild at this time, night minima of 54°F. and 53°F. being recorded at New-

castle and Liverpool respectively on the 18th.

Sunshine aggregates were above the normal except in England S.W. and S. Wales. The excess was greatest in England N.W. and N. Wales and the Midland Counties where the percentages of the normal were 138 and 134 respectively.

In the western English Channel an easterly gale was blowing

almost continuously from the 6th to the 11th.

* The hours of observation are 9 a,m, and 9 p,m, local time.

+ The normals used are obtained from observations extending over 35 years (1881–1915).

Pressure is expressed in millibars (1000 mb. = 29°581 mercury-inches). Wind Force.—The Summary is obtained from the records of a cup anemograph having 5 in. cups and 15 in. arms
The factor used is 3. Winds above 43 miles per hour are reckoned a sgales and winds between 21 and 43 miles per hour as moderate or strong winds. Direction is not sabulated when the
speed of the wind is less than 5 miles per hour and winds of less than that velocity are counted as calm,

Table XII—continued.
